LIQUID OR TABLETS—SAME FAST RELIEF

Uncle Sam Says

It's just ten years ago since we began to remember Pearl Harbor. Plenty has happened since then, but didn't the time go fast? Another ten years will be just as quickly. Are you preparing to be better off than you are now? One way is to invest part of your earnings now in U. S. Defense Bonds. Purchase them regularly through the Payroll Savings Plan where you work, or the Bond-A-Month Plan where you bank. In 20 years, they will return you 77 per cent more than your original investment.

IN the Clerk's Office of the Circuit Court of Appomattox County, on the 21st day of November, 1951, R. L. Burke, Plaintiff,

vs.

William W. Burke, Defendant.

The Bank of Appomattox, Plaintiff.

Against David W. Cawthorne, Mary L. Cawthorne et als

Defendants.

The object of this suit is to adjudge the proper ownership and right to a certain diesel engine now in the possession of Oscar T. Jamerson and which was formerly in the possession of David W. Cawthorne, Title and the right to the possession of the engine is claimed by the plaintiffs to this action under a deed of trust executed by David W. Cawthorne to secure a debt.

And it appearing by affidavit filed that David W. Cawthorne and Mary L. Cawthorne are not residents of this state, they are hereby required to appear within ten days after the due publication of this order and do what is necessary to protect their interests.

Bossie May Soon Enjoy Sawdust Meal That's Digestible

During the period prior to World War II, when Adolf Hitler was building up an arsenal of weapons with which he intended to conquer the world, a nuclear physicist at the University of Berlin had an idea for a death-ray gun.

The only thing wrong with the idea was that the inventor intended to use the death rays to kill miscreants that spoil food. Hitler wasn't interested.

America thrives on inventions that promote health and make for better living. It provides a Patent System as an incentive for such inventions. Dr. Arno Brach, the nuclear physicist with the death-ray idea, and his associate, Dr. Wolfgang Huber, left Berlin for New York 12 years ago.

Food is an important item of trade, here, and financial interests backed the two physicists in developing their electronic gun to the extent of a half-million dollars. They ran an "ice-cream" business and scrounged the area for hard-to-get parts required for their electrical apparatus. The pilot model, resembling somewhat the steel skeleton of a skyscraper, began to tower toward the ceiling. Near this was a cylindrical structure, tapering in sections to the top.

Out of this combination of transformers, insulators and giant electronic tubes there protruded a device similar to the muzzle of a gun, aimed directly underneath. A 220-volt house current was thus stepped up to shoot 2,000,000 volts.

It was five years ago that this amazing gun began its operation of shooting electron bullets into specimens of food.

At the Research Laboratory, workers and sawdust made from basswood were irradiated in a machine similar to the million-volt x-ray unit. They were then sent to the University of Washington for actual testing.

Since the tests could not be made with live cows, the workers used cultures of bacteria from a cow's stomach, irradiating the bacteria with the electron beams.

At the intensity of radiation used, exposures of less than a minute had no great effect. An exposure of 10 minutes, however, had a target directly underneath. A 220-volt house current was thus stepped up to shoot 2,000,000 volts.
